19. ABSTRACT <i>(Continue on reverse if necessary and identify by block number)</i> Accident investigation records of U.S. Army helicopter crashes show injuries of pilots due to striking a structure inside the cockpit outnumber those due to excessive accelerations by a five-to-one ratio. This two-volume report presents the results of a study of the effectiveness of airbags in reducing the severity of contact injury to the gunner when striking the gunsight. Airbag systems were installed on the gunsights in simulated Cobra and Apache cockpits, then sled tested at 7 and 25 g. The tests indicated airbags reduced head accelerations by 65 percent, head injury criteria by 77 percent, and head angular acceleration by 76 percent in the Cobra tests. In the Apache tests, the airbags reduced those same indicators by 68, 52, and 83 percent. An airbag system, the report concludes, is likely to prevent severe or fatal head and chest injuries in an Apache or Cobra crash. Volume 1 of the report describes the tests and discusses the results. Volume 2 consists of Appendixes A, B, and C of the report and contains processed signal graphs of all sled tests.

Appendix A

This appendix contains the processed transducer signals from the 11 (Cobra) telescopic sighting unit (TSU) tests with inertia reels and without airbags.

These include eight tests (LX6196 - LX6204) conducted during the first phase of testing and three tests (LX6274 - LX6276) which were run in the second phase.

Figures A-1 thru A-11 show the sled acceleration pulses and computed velocity and jerk signals for the 11 tests.

Figures A-12 thru A-22 display available components and resultants head linear accelerations.

Figures A-23 thru A-33 display the head roll acceleration signals and computed angular velocities and displacements.

Figures A-34 thru A-44 show the head pitch acceleration signals and computed angular velocities and displacements.

Figures A-45 thru A-55 display the amounts of belt extension and the computed velocities and accelerations.

Appendix B

This appendix contains the processed transducer signals from the 11 AH-64 (Apache) optical relay tube (ORT) tests with inertia reels and without airbags.

These include 10 tests (LX6208 - LX6217) conducted during the first phase of testing and one test (LX6277) which were run in the second phase.

Figures B-1 thru B-11 show the sled acceleration pulses and computed velocity and jerk signals for the 11 tests.

Figures B-12 thru B-22 display components and resultants head linear accelerations.

Figures B-23 thru B-33 display the head roll acceleration signals and computed angular velocities and displacements.

Figures B-34 thru B-44 show the head pitch acceleration signals and computed angular velocities and displacements.

No belt extension signals were available for these tests.

Appendix C

This appendix contains processed transducer signals from 11 tests where an airbag was mounted below the gunsight to supplement the standard restraint system in the Cobra and Apache.

These include five Cobra tests (LX6269 thru LX6273) and six Apache tests (LX6278 thru LX6283) which were all conducted in the second phase of testing.

Figures C-1 thru C-11 show the sled acceleration pulses and computed velocity and jerk signals for the 11 tests. Note for test LX6269, the sled pulse was the only transducer signal that was available for processing.

Figures C-12 thru C-21 display components and resultant head linear accelerations.

Figures C-22 thru C-31 display the head roll acceleration signals and computed angular velocities and displacements.

Figures C-32 thru C-41 show the head pitch acceleration signals and computed angular velocities and displacements.

Figures B-42 thru A-51 display the amounts of belt extension and the computed velocities and accelerations.
